1 Robocopy Command Generator

I've developed an interactive web-based tool that simplifies creating robocopy commands through a user-friendly graphical interface. Instead of memorizing complex command-line syntax, users can simply select options and generate commands visually.

Open in New Tab View Source Code

2 Features

The tool provides an intuitive interface for:

- **Source and Destination Selection**: Easy path input with validation
- **Copy Options**: Checkboxes for common robocopy parameters like `/E`, `/MIR`, `/R:n`, etc.
- **Real-time Preview**: See your robocopy command as you build it
- **Copy to Clipboard**: One-click copying of the generated command
- **Parameter Explanations**: Tooltips and descriptions for each option

3 Technical Details

This tool is built with vanilla HTML, CSS, and JavaScript, making it lightweight and fast. It's hosted on GitHub Pages, which means it automatically updates whenever I push changes to the source repository.

The interface translates user selections into proper robocopy syntax, helping both beginners learn the command structure and experienced users save time on complex operations.

4 Use Cases

This tool is particularly useful for:

- System administrators managing file synchronization
- IT professionals setting up backup routines
- Anyone needing to copy large directory structures with specific parameters
- Learning robocopy syntax through visual exploration
